

1 **Ocean Power Technologies Inc. Commercialization Call Script**

2

3 **Operator Comments**

4

5 Good afternoon, ladies and gentlemen, and welcome to Ocean Power
6 Technologies' Commercialization Strategy Update Conference Call. My
7 name is Nicole, and I'll be your coordinator for today. (Operator
8 Instructions) As a reminder, this conference call is being recorded. I
9 would now like to turn the presentation over to your host for today's
10 call, Mr. Steve Calk, Investor Relations for Ocean Power Technologies.
11 You may begin.

12

13 **Introduction**

14

15 Good afternoon and thank you for joining us. On the call with me today
16 are George Kirby, President and Chief Executive Officer; and Matt
17 Shafer, Chief Financial Officer. Following our prepared remarks, we will
18 open the call to questions. This call is being webcast on our website at
19 www.oceanpowertechnologies.com. It will also be available for replay
20 after this call. Now let me reference the safe harbor provisions of the
21 U.S. securities laws for forward-looking statements. This conference call
22 may contain forward-looking statements that are subject to significant
23 risks and uncertainties, including the future operating and financial
24 performance of Ocean Power Technologies or OPT. Although OPT
25 believes that the expectations reflected in its forward-looking
26 statements are reasonable, it can give no assurance that such

27 expectations will prove to be correct. Important risk factors that could
28 cause actual results to differ materially from those reflected in the
29 forward-looking statements are included in OPT's filings with the SEC.
30 The information contained in this call is accurate only as of the date
31 discussed. Investors should not assume that the statements will remain
32 operative at a later time and OPT undertakes no obligation to update
33 any information discussed in this call. Now, I'm pleased to introduce Mr.
34 George Kirby, CEO of Ocean Power Technologies. George?

35
36 **George H. Kirby – President and Chief Executive Officer**

37
38 Steve, thanks. Hello, everyone, and good afternoon. Thanks very much
39 for joining. I'll just remind everybody that there are slides available
40 through the NASDAQ site. So, I'd appreciate if you're able to join along,
41 and I'll be referring to the slides as we go. They'll be available after the
42 presentation on the website as well. The intent of today's update is to
43 help you to understand what types of opportunities OPT is pursuing,
44 why we're pursuing them, and just how prolific the opportunities really
45 are globally. Today, I'll begin by speaking briefly about the market
46 conditions that we're seeing and selling into. Then I'd like to discuss the
47 3 applications for our PowerBuoy, where we're experiencing the most
48 interest. After this, I'll speak about our most recent contract with Eni.
49 And then I'll wrap up with a brief discussion around how we're
50 managing our opportunity pipeline.
51 So I am on Slide 3. Today -- I'm sorry, the offshore environment
52 continues to transform through the use of data intensive networks. And

53 this is true for all of our target markets, including offshore oil and gas,
54 security, defense, science and research and telecommunications. For
55 instance, the science community could benefit tremendously in
56 understanding climate change from a constant stream of environmental
57 intelligence in remote ocean areas as opposed to a batch of data, which
58 is picked up and analyzed every 6 months. Access to data throughout
59 the offshore oil and gas operations is driving cost improvements,
60 allowing for better uptime and productivity, and in some cases, even
61 increasing oil reserve recovery. Companies like Statoil, Shell, Eni are
62 establishing remote operation centers, which enable employees to use
63 real-time data from rigs and subsea equipment in order to make real-
64 time decisions from land. The Norwegian operator Statoil envisions the
65 oilfield of the future through its remotely operated factory concepts,
66 through which they expect to see significantly less capital and operating
67 expenses as a result. BP is using unmanned vehicles for an equipment
68 inspection, which considerably reduces costs and cycle time, and also
69 allows for less expensive planned maintenance, as opposed to
70 unplanned maintenance, which result in much higher costs and reduced
71 productivity due to unnecessary downtime. As we're discussing various
72 uses for the PowerBuoy or applications, it's important to understand a
73 few of the aspects of the target markets, such as offshore oil and gas. I'll
74 mention a few of these here. In the upper right image of Slide 4, you can
75 see a representation of oil and gas systems over tens and sometimes
76 hundreds of miles. Oil patches or fields extend hundreds of square miles
77 across the ocean. The offshore oil and gas industry maintains subsea
78 equipment, which as you can see, resides on the seafloor, miles away

79 from the primary well to address different pockets of oil, called
80 marginal fields. These pockets of oil are connected to the main
81 offloading site by pipes call tiebacks. These marginal fields require
82 power and communications to operate the subsea equipment. That
83 power may use large diameter umbilicals similar to large extension
84 cords that come out from the rigs in order to bring power and
85 communications along the tieback to the marginal field.

86 Some examples of where power and communications are used might be
87 for controlling pumps, valves, flow regulation and Chemical Injection
88 systems. Remotely operated vehicles or ROVs, have been used for
89 subsea operations for decades. They consist of drone like vehicles
90 attached through a transport cage and back to the top side ship or
91 vessel, with a power and communications umbilical. Smaller ROVs have
92 been used for exploration, recovery and research to bring live video of
93 the subsea world back to the surface. I think everybody has seen the
94 video of Eni vessels
95 that are recovered off the sea floor. They used ROVs to bring that video
96 back to land. Larger ROVs look like robots, with manipulator arms that
97 can operate subsea equipment. These larger ROVs have become
98 instrumental to subsea
99 operations and have historically been deployed and operated from
100 ships. So one example of subsea charging is the use of electric ROVs, or
101 eROVs. eROVs are intended to be deployed by a ship and left to sit on
102 the ocean floor for longer duration missions, while the vessel leaves and
103 heads to port. Instead of receiving power from the topside vessel, the
104 transport cage, which the vehicle deploys from, will have batteries to

105 power the vehicle. Then communications can be run from a topside
106 communications buoy. The PowerBuoy is uniquely suited to charge the
107 eROV batteries in order to allow it to stay down much longer or even
108 reside on the seafloor during long-term operations. This extends the
109 overall mission capability of the eROV, eliminates the need for the
110 communication buoy and provides even more energy storage
111 capabilities onboard our PowerBuoy. We're also considering a
112 Generation-only PowerBuoy, which would have no energy storage
113 system, but would allow for a more rapid deployment and
114 would only trickle charge the eROV batteries. Next slide. Similar to
115 ROVs, are our Autonomous Underwater Vehicles, or AUVs. AUVs are
116 being used more and more throughout offshore oil and gas, defense, and
117 science and research. AUVs contain batteries directly inside the vehicle
118 and have a mission duration of a few hours to a day or 2,
119 depending on its mission requirements. All of the data collected by an
120 AUV is stored onboard the vehicle. Today, a vessel will come out to the
121 site, where the AUV is to operate, and deploy the AUV using a crane.
122 When the AUV mission is over, it will surface and the vessel crane will
123 crane the AUV onboard, where the data is downloaded and the batteries
124 are replaced. These AUVs are mainly used for data collection, but
125 companies like Saab have an AUV called the Sabertooth, which is
126 depicted in the lower left picture, which has tools on board that can
127 manipulate valves and other operations. Both the defense industry and
128 offshore oil and gas are working with manufacturers to develop AUV
129 garages, where the vehicle can park, download its data, upload a new
130 mission profile, recalibrate its GPS and recharge its batteries, all within

131 a 6 to 12-hour time frame. These industries have recognized the
132 PowerBuoy as ideally suited to provide additional energy storage as
133 well as a perpetual charging mechanism. The idea that these AUVs can
134 reside on the seafloor as full-time eyes and ears and to conduct remote
135 operations from land without the need for a
136 vessel and crew at sea.

137
138 Next slide, please. Subsea batteries are used to provide prime and
139 auxiliary power to subsea operations. One example of this is Chemical
140 Injection Systems. There are companies that make batteries that are
141 designed for the extremely high pressures encountered on the seafloor
142 for months at a time. Oftentimes, specially designed 40-foot containers
143 are filled with batteries and positioned right next to operations for
144 powering equipment. OPT's PowerBuoy could be an excellent solution
145 for extending the useful life of these battery systems, and possibly, even
146 reducing the amount of batteries needed, given the recharging
147 capabilities. This latter point creates a really important economic value,
148 causing operators to rethink the way that we've been addressing subsea
149 operations. This illustration is a great depiction of our second
150 application, surveillance and monitoring from our friends from
151 Kongsberg, who's a Norway based provider of offshore solutions. That
152 accurately points out the critical areas where our PowerBuoy can play
153 an important role, such as monitoring, surface threats, facilitating
154 collision avoidance and monitoring threats below the surface. One
155 absolutely huge area for PowerBuoy surveillance and monitoring is the
156 decommissioning of offshore oil and gas platforms and subsea

equipment. When assets have reached their useful life, or once an oil reserve has been depleted, the operator needs to remove their equipment from the surface and the seafloor, and restore the seafloor to its original condition. Right now, there are well over 1,000 sites in the North Sea and hundreds of sites in the Gulf of Mexico that are being planned for decommissioning over the next 7 years. Each of these sites could potentially utilize 1 or several PowerBuoys to act as unmanned surveillance stations, and to monitor subsea wells during plug and abandonment activities. The PowerBuoys would essentially provide remote surveillance and monitoring in place of a vessel and crews, thus reducing significant cost and reducing the operator's carbon footprint. Let me take you through an example. Next slide, please. In the North Sea, offshore oil and gas operators require a minimum 500-meter safety zone around platforms that are undergoing decommissioning and dismantling. This safety zone has historically been maintained using boats and crew, although day rates make this really expensive, oftentimes as much as \$5,000 per day over multiple months or even years. There are also all these safety considerations as these boards and crew are required to be on station, even during severe weather conditions. And oftentimes, these guard vessels will only have the ability to monitor above the sea surface, leaving the operator to find a different solution for subsea equipment monitoring. The solution would be to use one or more PB3 surveillance PowerBuoy. PowerBuoys are unmanned and create perpetual power and provides a platform for surveillance, monitoring and communications equipment, where operators can monitor both above and below the sea surface and communicate with

approaching vessels from the safety of land. In working with one operator, we determined that the resulting cost savings is upward of 30% to 50% per year, per vessel replaced. We believe that the revenue potential is based on single or multiple PowerBuoy leases per site per year for this type of application. We also believe that there are potentially hundreds of opportunities globally per year, assuming that there are multiple sites per decommissioning event. It's important to note that some operators will prefer to purchase PowerBuoys rather than lease them. And that PowerBuoys sales become more economic for projects lasting longer than 1.5 to 2 years. So the typical payloads on a surveillance PowerBuoy would include infrared cameras, passive acoustic monitoring, high-frequency radar, an AIS transponder, a fog horn, 4G and WiFi communications, satellite communications, well head sensors, high-definition video, both on the surface as well as subsea, and meteorological and oceanic sensors. All of these can be powered by the PowerBuoy. Next slide. So far, we've been discussing applications in relatively shallow water or up to about 1,000 meters deep. As operators continue to move further out to sea, the continental shelf drops away to very deep water or sometimes -- oftentimes up to 3,000 meters. Though we believe that we can use today's mooring technology in order to anchor in these waters, it becomes very expensive for the anchor lines and floats required for the mooring system. So one solution is to forgo the mooring system by using an anchorless PowerBuoy, which we're currently developing for the U.S. Navy's Office of Naval Research. This PowerBuoy would use a patented approach to power generation, would contain energy storage similar to the PB3, and could also have a diesel

209 generator on board, which uses a clean biodiesel in order to supplement
210 peak power requirements. The buoy would be self-propelled and would,
211 therefore, not need an anchor in order to stay on station. In fact, the
212 PowerBuoy may even be capable of launching from land and self-
213 navigate to its desired station. We're well into the conceptual design for
214 this anchorless PowerBuoy, and the next major steps are to finish the
215 detail designs and create a prototype for the Office of Naval Research.
216 We've experienced so much enthusiasm for this design from the U.S.
217 Navy, defense contractors in the offshore oil and gas industry that we've
218 decided to continue development of the PowerBuoy
219
220
221 on our own dime until such time that the Navy's new budget
222 materializes into further funding for this project. We actually expect this
223 to occur in the coming months. Okay. Last application number 3, the
224 third and final application that I'd like to briefly discuss is offshore
225 connectivity. Marine industries have historically used satellite
226 communications for voice and data. This is because land-based cellular
227 signals are lost about 25 miles out to sea. Though bandwidth
228 capabilities of satellite communications have dramatically improved
229 over the years, the service is still very expensive and accounts for a
230 significant percentage of operating costs. Companies like Norway-based
231 Tampnet have invested in laying fiber from land throughout the North
232 Sea to create a network for 4G cellular. The fibers then brought up to the
233 offshore oil platforms to cellular antennas, where 4G signals are cast out
234 to other platforms. Tampnet is well positioned to do the same

throughout the Gulf of Mexico and is currently working with operators to make it happen. 4G is believed to bring significant cost savings over satellite communications to not only the offshore oil and gas industry but all marine industries that operate on the high seas. Expanding on this application a little bit more, we found that the offshore oil and gas industry is projected to spend nearly \$0.5 billion on satellite communications, and the global maritime industry will spend over \$3 billion. The need for offshore access to 4G cellular technology is driven by the ever-increasing intensity of data usage by these industries. This illustration on this slide shows the hundreds of offshore oil platforms in both shallow and deeper water. These platforms are used as a quasi-cell tower as the fiber is brought up from the seaport to antennas, mounted high on the platform to create networks. Oftentimes, these networks will experience coverage gaps, similar to what we all experience with our mobile phones, as we travel between cell towers and our signal strength increases, it decreases and sometimes disappears, until we come within range of the next tower. As companies like Tampnet wire the Gulf waters with fiber and create a 4G cellular network, operators will depend on these networks and require extremely high levels of availability and reliability. Next slide. We believe the solution to these coverage gaps is our PB3 PowerBuoy, in this case also called a CellBuoy. 4G signal depends on line of sight. So the cell buoy acts as a stable platform, where a very tall mass, possibly 80 feet to 100 feet tall, can be installed to support cellular antenna equipment. The CellBuoy would be attached to the seafloor only with mooring lines and an anchor. In addition to a stable platform, the cell buoy can provide persistent power

261 to the 4G equipment as well as a WiFi hotspot for passing ships.
262 Coverage gaps would be closed as the CellBuoy works as a repeater
263 station where the 4G signal would be captured, its power significantly
264 increased and then rebroadcast to the next 4G antenna. The alternative
265 to a repeater station is that the CellBuoy could work as a base station,
266 where the fiber is actually brought up from the seafloor through the
267 mooring lines to the CellBuoy, and the 4G signal is broadcast to other
268 locations directly from the base station. Both of these solutions would
269 significantly harden the 4G infrastructure and allow companies like
270 Tampnet to push further out to sea with their network. Now, I'd like to
271 switch gears and speak about our contract pipeline. The Eni contract
272 really is a monumental milestone in OPT's history. For the first time, we
273 are delivering a PowerBuoy into the offshore oil and gas industry,
274 specifically, to address the burgeoning needs of subsea charging. We
275 believe that this contract is the catalyst for global operators to choose
276 our solution for their subsea charging needs, and we're already hearing
277 this from future customers. We've been working with Eni on this
278 opportunity for well over 1 year. We finally began to scope the project
279 in April of last year. We then needed to go through an extensive vendor
280 qualification process, which lasted throughout last summer. Both Eni
281 and OPT expected that we would have a contract in place by September
282 of 2017. However, contracting ended up taking another 6 months.
283 Under the contract, the initial lease period for the PowerBuoy is 1.5
284 years. And Eni wanted the option to be able to extend the lease for
285 another 1.5 years as well as the ability to purchase the PowerBuoy
286 outright. The Eni S contract, which was made publicly available in 2016,

287 is a great reference point to understand the potential revenues that can
288 be derived from PowerBuoy lease contracts in general. And aside from
289 the lease itself, contracts most always include important revenues from
290 project management, engineering services, deployment support and
291 deployment monitoring services. This contract with Eni is no different.
292 And in addition, Eni agreed to bear significant cost for us, including but
293 not limited to, deployment cranes, vessels, crew, expensive insurance
294 premiums and storage of the buoy. As part of the contract, Eni required
295 us to include provisions for multiple buoy purchases, and we agreed. Eni
296 also required us to include provisions for sharing any intellectual
297 property that we may develop together, and we also agreed. Each of
298 these contract provisions position Eni and OPT to jointly market subsea
299 charging solutions outside of this agreement. We're extremely pleased
300 to not only have Eni as a customer but also as an important partner
301 moving forward.

302
303 Next slide. All right. I'd like to spend a few moments discussing our sales
304 and lease pipeline as well as the typical process to actually get to
305 meaningful contracts. Over the last 3 years, we've spent an enormous
306 amount of time educating our target markets, understanding their
307 operations and looking for ways to use our PowerBuoy to either save
308 them money or to enable newer purchase. We're continuously focused
309 on identifying potential customers, developing applications for our
310 PowerBuoy and articulating the clear value proposition that we bring.
311 We call this product positioning, and we spent probably 25 -- I'm sorry,
312 20% of our time on this. Once we've identified a mutual opportunity

313 with the customer, we spent a large amount of time scoping the solution
314 and developing the specific economic business case. This includes
315 exploring and understanding all of the risks associated with doing
316 things differently by using our PowerBuoy instead of proven, though
317 oftentimes expensive, methods. From there, we moved through a series
318 of proposals. The first being a rough order of magnitude estimate of
319 costs, which is usually plus or minus 30% to 40% of what the project
320 will actually cost. Once we understand more of the cost inputs and
321 assumptions, customers oftentimes ask for a budgetary proposal, which
322 is typically plus or minus 15% of the final cost. The customer will use
323 this information to secure funding and gain internal approvals. The last
324 step is to provide a final detailed proposal using all of the collected
325 information to date. All of this effort results in about 10% of our time.
326 The reason this area is smaller is a smaller percentage of the total time
327 spent is because we've become very efficient at turning out proposals.
328 We've been incredibly focused on reducing the time that it takes to get
329 to a contract by collecting information well in advance on a customer's
330 purchasing process. Usually, the most amount of time is spent in
331 negotiating the final contract. Though we're able to make decisions very
332 quickly and turn around contract reviews and comments in short order,
333 oftentimes our customers have a more lengthy purchasing process,
334 which takes them more time to respond. What we found is that all of our
335 customers are excited to use our products and services and work
336 diligently toward a mutual outcome. Just as we needed to go through
337 supplier qualification with Eni in order to get to a contract, we've had to
338 do the same with others as well. As much as we believe these important

339 milestones are newsworthy, our customer counterparts oftentimes
340 don't. And we are precluded from discussing it, given our nondisclosure
341 agreement. And speaking about our actual pipeline of opportunities, I'll
342 say that we definitely have a strong and growing one. Here are some
343 individual examples that we're pursuing in earnest. One operator sees
344 our ability to provide power to subsea equipment on very long tiebacks
345 as an obvious opportunity. Two ROV service providers are using our
346 PowerBuoy in their marketing to operators as a solution for charging
347 and energy storage. 2 oil and gas operators are conducting studies
348 around the use of our PowerBuoy in their operations. One multinational
349 company is interested in leasing or even buying a PowerBuoy for initial
350 use in South America. One telecommunications company is expressing
351 interest in using our PowerBuoy as a repeater station in order to fill the
352 gaps between 4G cellular signals. So as you may have learned from prior
353 discussions, we continue to expand our sales presence in the U.S. and
354 Europe, as we address each of these applications that I've discussed and
355 have actual PowerBuoys supporting those critical operations, we expect
356 to see a high rate of adoption globally in order to muster cost savings
357 across these industries. Because of our continued work to transform our
358 company, I expect that we're able to deliver more contracts in the near
359 future. So in closing, we believe that our investment thesis is stronger
360 than ever. Our product is extremely innovative. We have a very robust
361 intellectual property portfolio. We're positioned to display some very
362 big market costs. Our target markets are both attractive and diverse.
363 And our management team is very experienced in commercializing new
364 products, and scaling and growing very complex and technical

businesses by using a disciplined approach. I really hope today's presentation was helpful in understanding not only where we're at, but where we're going. Operator, this is the end of my presentation, and I'd now welcome any questions that anyone has.

Question-and-Answer Session

Operator:

(Operator Instructions) Our first question comes from Peter Ruggiere from Dawson James.

Peter G. Ruggiere

Questions for you. How many buoys do you have in the water right now?

George H. Kirby

None right now. We've got a few sitting out in their back parking lot waiting to be shipped and more being built. One in particular for Eni and others for demand that we're seeing.

Peter G. Ruggiere

When do you expect any revenue to come from any of these projects?

391

392 *George H. Kirby*

393

394 Well, I mean, as you know, we're seeing revenue from our Premier Oil
395 study and the Eni project is going to yield revenues and cash in the door
396 pretty rapidly under the contract. We're already well into it.

397

398 *Peter G. Ruggiere*

399

400 Okay. Here's another question. You guys have been doing this for about,
401 what, 3 years and \$200 excess million and you have 65-plus patents.
402 What do you think the technology is worth per share?

403

404 *George H. Kirby*

405

406 That's a good question. I'd have to give that some thought, but I can tell
407 you, yes, this company has been hard at it for 25 years, mostly focused
408 on research and development. Since I've gotten here and Matt and John
409 Lawrence, our General Counsel and the whole management team,
410 within 3 short years, we've turned this company around into an
411 operational company.

412

413 *Peter G. Ruggiere*

414

415 You guys are doing great.

416

417 ***George H. Kirby***

418

419 Pardon?

420

421 ***Peter G. Ruggiere***

422

423 No. I said, you guys are doing great.

424

425 ***George H. Kirby***

426

427 Thank you very much. Another point I'd mention, if you look at -- my
428 background is coming from big companies like GE. If you look at some of
429 the press releases that GE is putting out, they're investing \$400 million
430 in a new wind turbine. I mean, so to spend a lot of time to develop a
431 technology, to investment a lot of money in getting that technology right
432 and to building markets around that technology takes time and it takes
433 money.

434

435 ***Peter G. Ruggiere***

436

437 It's interesting, I ran into somebody, and she works for a -- I forgot who
438 it was, but she's an engineer, but I think the government's going with
439 lower costs and renewable energy and asked about OPT and she's like,
440 yes, they're one point, which is actually good.

441

442 ***George H. Kirby***

443

444 Yes, one thing that I'll mention about OPT is we are subsidy free. We are
445 making this happen under our blood, sweat and tears. Go ahead.

446

447 *Peter G. Ruggiere*

448

449 I think the last -- the one question is, you guys have about a year of cash
450 left at this point. When's the next dilution? And there's somebody else --
451 and here's the second part of that, is somebody else planning on maybe
452 putting (inaudible) into supporting you instead of diluting more shares.

453

454 *Matthew T. Shafer*

455

456 Yes, Peter, this is Matt. To answer your first question or observation, as
457 you know, we have \$14.4 million of cash as of the end of the quarter,
458 January. Our budgeted average monthly burn rate is about \$900,000 per
459 month. We've been running a little bit shy of that so, which is a positive
460 thing. But doing the math, that gets us out through like you said, a year
461 from now. So through April of 2019. We have obviously been scaling the
462 business, but we also have been pulling back on some other types of
463 research -- development type of work. So we have some puts and takes.
464 So we're keeping with that monthly burn rate. Currently, we are going
465 through our 3-year strategic planning process. So we'll have a better
466 line of sight into our capital needs into the future, in the coming months.
467 So I know that doesn't answer your question, but it gives you a little
468 more clarity around where we're at right now today.

469

470 *Peter G. Ruggiere*

471

472 Right. Some -- I've worked with Level 3 -- I was invested in Level 3 for
473 years, and they have the most extensive fiber-optic network out there.
474 And the thing you have Project Loon with Google running offshore, what
475 they're doing with these balloons and stuff like that, I mean, the buoys
476 are perfect for that. I think we've talked about this on a couple of
477 conference calls back. Have you been talking with Google about this at
478 all?

479

480 *George H. Kirby*

481

482 I have talked to Google. I've got former colleagues that are working for
483 Google in their Energy group. And I'm pretty in tune with some of the
484 technologies that they're influencing, as well as others. The -- really, the
485 opportunities are -- I don't want to say that they're not limitless, right?
486 But they're hard to really even understand right now. If you go back to
487 1995 and you started talking about the iPhone, everybody would be
488 like, they would be saying, what are talking about? We have this
489 Motorola flip phone that works just fine. The idea is that the PowerBuoy
490 is meant to penetrate
491 these markets by eliminating cost -- unnecessary cost, bringing an
492 unmanned station to there. But by bringing power and communications
493 to remote locations. What you do is, you open up new opportunities to
494 enable new technologies. So there might be opportunities with AUVs

495 and having landing pads on our PowerBuoys. We're thinking about all of
496 that, we're thinking about the big data aspect of these markets that
497 we're going after. And who should we be talking to and partnering with
498 around understanding and trying to facilitate big data through our
499 PowerBuoys. But really, right now, we're not focused as much on that
500 far thought -- that far out thought, we're not focused on further capital
501 raises. We are 100% focused on commercializing this PowerBuoy.

502
503
504 ***Peter G. Ruggiere***

505
506 This is going to be a far-fetched question, but when do you expect a
507 contract where you get say like a milestone payment?

508
509
510 ***George H. Kirby***

511
512 I'm not sure I understand the question, Peter.

513
514 ***Peter G. Ruggiere***

515
516 The question was, how close are you getting to a milestone payment to
517 where you're paid \$5 million or \$10 million, \$20 million to build 10, 20
518 buoys?

519
520 ***George H. Kirby***

521

522

523 I think, what you're asking is, how close are we to a multiple-buoy
524 order, maybe?

525

526 *Peter G. Ruggiere*

527

528 Yes.

529

530 *George H. Kirby*

531

532 As I mentioned in this presentation, Eni has positioned for that, right?
533 It's written into the contract, and the contract is available, it's been 8-K-
534 ed, anybody can read it that we are positioned to roll out multiple
535 power buoys with Eni.

536

537 *Operator:*

538

539 (Operator Instructions) And I'm showing no further questions. I would
540 now like to turn the call back to George Kirby, CEO, for any further
541 remarks.

542

543 *George H. Kirby*

544

545 Hey, thank you. So I appreciate everybody joining. This is going to be
546 posted up on our website under the Investor Relations section of our

547 website. I'll also point out, please follow us on social media. We have
548 taken a new position on social media, we're trying to post more, we're
549 really trying to pull back the curtain on all of the great things that we're
550 doing, who we're talking to, our technology and innovation. And soon,
551 we'll be talking more about our people as we continue to grow. Twitter,
552 Facebook, Instagram, LinkedIn, these are all great ways to stay in touch.
553 And I appreciate everybody's interest in today's presentation. Thank
554 you.

555

556 ***Operator:***

557 Ladies and gentlemen, thank you for participating in today's conference.
558 This does conclude today's program. You may disconnect. Everyone,
559 have a great day.
